Project Overview & Objectives

- **Core Objective:** Demonstrate advanced version control proficiency using the Git CLI and GitHub repository management.
- **The Deliverable:** A fully functional, interactive web application hosted on GitHub Pages, moving beyond a basic static landing page.
- **Key Features:** An educational Git simulator equipped with a live workflow visualizer, a command dictionary, and an animated mascot (GitBot).
- **Technical Stack:** Clean architecture separating structure (HTML), aesthetics (CSS), and interactive logic (JavaScript), with a foundational backend setup in Java.

Initial Repository Setup & Linking

- Created a new public repository on GitHub named DevelopmentAndGitMastery to act as the central host.
- Established the local project structure within IntelliJ IDEA.
- Linked the local environment to the remote GitHub server using the git remote add origin command.
- Verified the connection to ensure seamless synchronization between the local IDE and the cloud.

```
git remote add origin https://github.com/daa0010/DevelopmentAndGitMastery.git
```

Modifying

- Implemented "Stage Management" to ensure only verified code was prepared for inclusion in the project history.
- Recorded permanent snapshots of the project using the git commit command with descriptive messages.
- Maintained a clean development history by organizing changes into logical, atomic commits rather than one single massive update.

Deployment

- **Remote Synchronization:** Pushed the finalized local commits from the main branch to the remote GitHub repository using `git push origin main`.
- **GitHub Pages Integration:** Configured the repository to automatically build and host the interactive web application from the root directory.
- **Continuous Delivery:** Demonstrated the ability to synchronize local code changes with a live production environment in real-time.

Git Cheat Sheet

- **git init**: Initializes a new, empty local repository.
- **git status**: Displays the current state of the working directory and staging area.
- **git add [file] / git add .**: Moves specific files (or all changes) to the staging area, preparing them for a commit.
- **git commit -m "[message]"**: Records a permanent snapshot of the staged files with a descriptive label.
- **git branch [name]**: Creates a new, isolated timeline for developing features without affecting the main code.
